Assignment 1 – Explore n8n Case Studies

Leveraging Automation in Cybersecurity

- What problem/use case they had

As part of its cybersecurity objectives, Vodafone wanted to

- Expand logging and monitoring coverage to account for more assets, data types, and longer retention (from 90 days to 13 months) in order to be compliant with TSA requirements.
- Overcome resource strain from increased logging/monitoring without exponential staff increase, or additional strain on the existing engineering and CSOC teams.

- Where and why they implemented n8n

The traditional tools couldn't address Vodafone’s overall workflow capability and issues.

“Then they found n8n, which does both. It provides SOAR capability and a workflow capability in a low-code model, as well as the ability to code for more complex workflows and integrations. It did everything that we wanted, all in one tool,”

- How the workflow was implemented

“n8n and the flexibility it allows helped us in the design and development of an entire CI/CD, DevOps lifecycle. Utilizing n8n environments, we were able to build, develop, test, and deploy code and applications. This allowed us to easily and securely create and update workflows and take them through the lifecycle. It also allowed for version control and log streaming capabilities.”

- How n8n helped them in real-world scenarios

A fraud detection workflow which provides IP geolocation and fraud detection services to help businesses localize content, and enhance security.

world problem."
